Gnu Plot is a free to use command line program for generating graphs on multiple platforms and as a plotting engine for other programs. It has been actively developed since 1986.

Key Points to takeaway from this

1. Gnu Plot makes use of an editable post script file to modify how the visuals are created. This can be a very useful feature to have which would greatly aid accessibility and create a huge possibility for user modification. To implement this, it would be needed to design a structure for graphs with interchangeable attributes.
2. Gnu Plot has a freeware license that allows anyone to modify and freely use the application. An Open Source license for my own project might be something to look into for the far future
